

# A parts database tells you what the part is. Mike works the call.

Bluon is **very good at what it does** — 20 million model numbers, 200+ brands, specs and cross-references. A place a technician goes to *look something up*.

|                                                                                                                                               |                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <p>WHAT THAT SOLVES</p> <p>"What is this part, and what crosses to it?" Answered fast, from an enormous library. Genuinely best in class.</p> | <p>WHAT IT DOESN'T</p> <p>The tech is still the one diagnosing, quoting, and selling it. He looks it up alone, and decides alone.</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|

Bluon figures are their own published claims (bluon.com). We're not disputing them. The six pages that follow are things a reference library does not set out to do.

# He pulls the real warranty registration.

Photograph the data plate. Mike goes to **the manufacturer's own registry** and comes back with whether *that serial* is registered — or sitting on base coverage.

- **Not a link to their website.** The actual record on that unit.
- **Registration is the whole spread** — typically 5 years parts unregistered, 10 registered. Nobody registers it. Everybody assumes it's covered.
- **The tech knows before he quotes**, instead of eating the part when the claim is denied.

Carrier / Bryant / Payne

Heil / Tempstar / Comfortmaker

Arcoaire / KeepRite / Day & Night

Trane / American Standard

Goodman / Amana / Daikin

Rheem / Ruud

---

Verified end to end against each manufacturer's live registry on 31 August 2026. Lennox and Mitsubishi block automated lookups; those run through your own dealer account, and Mike says which is which rather than guessing.

## He gets talked to.

Call him. FaceTime him. Text him. **Hands full, gloves on, in an attic in August.**

A lookup tool needs two clean thumbs, a good screen and light. That is not the condition your technician is in when he actually needs help — he needs it at 2pm, on a ladder, with a customer watching.

### A DATABASE

Stop. Put the meter down. Take the gloves off. Type. Read. Go back to work.

### MIKE

"Hey Mike, I've got 3.2 inches of static on a 58STA and it's locking out on the high limit." Keep working while he answers.

# He runs *your* process.

Load your checklists and your standard, and every technician gets coached to **that** — not the habits he brought from his last shop.

- **Same answer on every truck, every shift.** That is the thing a growing company cannot buy with training days.
- **Your process stays yours.** It doesn't become someone else's product.
- A library has one answer for the whole industry. It has no idea how *you* want it done.

This is what makes an acquisition integrate in weeks instead of quarters — the acquired crew works your way from day one, without a classroom.

## He redraws the wiring diagram.

Photo of a messy OEM schematic — back comes **a clean, labeled drawing**, every wire numbered, with a legend for what each one does and a glossary of the terminals.

- He **reads the model off the sheet** and files the clean version, so the next tech on that unit gets it instantly.
- Same circuit — simplified, not invented. He tells the tech to check it against the real manual before working a live unit.

---

Outdoor units today. Furnace and air-handler diagrams are in build and will not be claimed until they are tested against real manufacturer schematics.

# He gets the tech to the sale — and teaches him.

The objections *before* he knocks. The words when the customer pushes back on price. And the coaching that makes the next call easier.

- **He never quotes a price to a homeowner.** That conversation stays your technician's. Built in on purpose.
- **He teaches at the man's level** — an apprentice gets the *why*, a twenty-year guy gets a second opinion.
- **Including the manager you promoted off the truck**, who now has to check work he can't diagnose himself. "Is this compressor under warranty?" is a management question, and Mike hands him the three to ask.
- **He says "I don't know."** In this trade a confident wrong answer is worse than no answer.

# Don't take my number. Take yours.

They publish 99% accuracy on their own test. **I'm not going to hand you a number of mine** — nobody has graded ours yet, and I'm not going to invent one.

## WHAT WE ASK

Thirty days. One branch — **the one that's struggling**, not your best.  
Your process documents and one person who can answer questions.

## WHAT IT COSTS

**Nothing.** No contract, no license, no invoice.

**Measured on what you already track:** callback rate, first-time fix, and how fast a new hire runs solo.

If it doesn't move a number you already keep, you walk.
