

A master tech riding with every truck.

Not one man's twenty-five years — **a hundred years of the trade**, in every technician's pocket. Call it, FaceTime it, text it.

43,690 excerpts from manufacturer service manuals, cited to the page	Every brand not tied to one manufacturer or platform	19 techs signed up and using it on real jobs	170 questions asked, 10 techs asking regularly
--	--	--	--

Point it at the nameplate — age of the unit, brand, what's still available, the right part number and its cross-reference.

It says "I don't have that one" instead of guessing. In this trade a confident wrong answer is worse than no answer, so that's built in on purpose.

You're hiring faster than you can teach.

Every new tech is a slow tech for months. When they're stuck they pull your senior guy off another job — **the most expensive help desk in the company**, and nobody's paying for it.

- **It develops them.** Coaches on the job, at their level. An apprentice gets taught, a veteran gets a second opinion. Teaches the *why*, so the next one doesn't need a phone call. EPA 608 and master-exam prep included.
- **It runs your process.** Load your checklists and your standard, and every tech gets coached to *that* — not the habits they arrived with. Same answer, every truck, every shift. Your process inside it stays yours.
- **It gets them to the sale.** Hands the tech the objections *before* the door — "here's what this customer is going to say" — then plays the customer so he rehearses on the drive instead of on your homeowner.
- **It never quotes a price to a homeowner.** That conversation stays your technician's.

Also for the managers you promote off the truck: what to look for on a ride-along, how to run the hard conversation, and somewhere to ask what they don't want to ask you.

A real call, unedited.

Not a demo script. This is what came back when a technician described what he was standing in front of.

TECHNICIAN

Carrier 58STA 80k furnace, 2019. No heat, intermittent. 3.2 inches static, plenum hit 182 and it locked out on the high limit. Filter looks dirty. What's the call?

MIKE

3.2 inches WC total static is your whole problem right there — that furnace is choking, and the high limit is doing exactly its job.

A furnace that size with a clean setup should be running you somewhere around 0.5 to 0.8 total. Pull that filter and re-measure — if you're still ugly high, now you're chasing the ductwork.

- Re-read static supply and return **separately** so you know which side is the choke.
- Check the blower wheel — a 2019 run on dirty filters packs the wheel and loses 20–25% of its airflow.
- Temp rise across the exchanger. Over the nameplate range and airflow is the confirmed cause, not a bad limit.

Don't replace that limit — it's the messenger. Fix the air.

What's the return setup look like? That's usually where the other half of that static is hiding.

Verbatim excerpt, trimmed for length. Nothing added.

He holds the price.

The moment most tickets are lost is after the number leaves the tech's mouth. **Every tech gets your best closer in his ear** — and the answer is never "discount it."

TECHNICIAN

Homeowner said "that price seems high, I'm going to get another quote." 3-ton condenser replacement. What do I say? Don't have me drop the price.

MIKE

Your instinct to hold the price is right. Never drop it just because they blinked — if you do, you just told them your first number was a lie.

Agree and slow it down: *"Smart move — I'd get another quote too if I were spending this kind of money. Can I ask you one thing before you do?"* Then go quiet. Most techs get defensive, and that's what makes a homeowner dig in.

Then arm them to shop apples-to-apples: *"Ask the next guy three things — what's the warranty on parts AND labor, are they pulling a permit, and is the coil matched to the condenser on an AHRI certificate. A quote a thousand less usually means a mismatched coil, no permit, or a one-year labor warranty instead of ten."*

Nine times out of ten the cheaper quote fails one of those three — and now they know it.

Verbatim excerpt, trimmed for length. Nothing added.

Your manager doesn't have to be a tech.

You promote a good operator into service management and they inherit decisions they can't check. **This is the part nobody builds for.**

SERVICE MANAGER • NO FIELD BACKGROUND

I came from retail, zero HVAC. A tech wants to replace a compressor on a 4-year-old unit, ticket is \$2,800. I can't tell if that's right. What do I ask him so I don't look stupid and don't get taken?

MIKE

You don't need to know HVAC to ask the right questions. You need to know whether your tech did his homework. That's a management skill, and you've got that.

- **"Is this compressor under warranty?"** A 4-year-old unit almost certainly still has parts coverage. If it's covered the part is free from the manufacturer and the customer pays labor. **A \$2,800 ticket that includes buying a compressor that should have been warranty-covered is the single most common way this goes wrong.**
- **"How did you rule out the cheap stuff?"** Compressors are the most expensive part in the box, so they're the most over-diagnosed. "I megged the windings, checked the cap, checked voltage at the terminals" is a real diagnosis. "It's just not running" is not.
- **"Why did a 4-year-old compressor fail?"** Something killed it. Replace it without finding that and the new one dies too — on your dime.

Ask those calm and curious, not accusing. A tech who gets defensive about the warranty question is telling you something.

Verbatim excerpt, trimmed for length. Nothing added.

Every callback erases a service call.

\$650 is what one callback costs the contractor — and it is roughly what an average residential service call is *worth*. Those are the same number.

\$100 the technician's time	\$300 truck, fuel, dispatch, overhead	\$250 the paying call you couldn't run instead	\$650 total cost of one callback — ACCA's figure, not ours
---	---	--	--

So a callback isn't a small loss. It's **a whole job you already did and didn't keep**.

THE USUAL FIX More training days, more ride-alongs, another senior tech on the phone. All of it costs the thing you have least of — your best people's hours.	WHAT THIS DOES INSTEAD The help arrives on the job, at 2pm, on the truck where the problem is. The tech who gets it right the first time never creates the ticket.
---	--

We're not claiming we take callbacks to zero. You already track this. Measure us instead of believing us.

It's live, and it does the unglamorous part.

Anything can answer a question. The hard part is being **right about a specific unit standing in front of a tech.**

- **Real warranty registration lookups.** Not "here's the manufacturer's website" — it goes and checks the registry and comes back with the actual coverage on that serial. Four brand families and eleven badges, verified against the live registries.
- **Nameplate scan.** Photo of the data plate: brand, model, serial, manufacture date, and whether the unit is registered for the extended term or sitting on base coverage.
- **Manufacturer manuals, cited.** 43,690 excerpts, quoted to the page, so a tech can check the source instead of trusting a paraphrase.
- **Wiring diagrams.** He sends a photo of the diagram and gets a clean, simplified drawing back.
- **Voice and FaceTime.** Hands are full, gloves on, in an attic — he talks to it.
- **It refuses to guess.** If it can't verify coverage it says so and says whose fault it is — our outage, the manufacturer's site, or a unit that was never registered.

Trane / American Standard

Carrier / Bryant / Payne

Heil / Tempstar / Comfortmaker

Arcoaire / KeepRite / Day & Night

Goodman / Amana / Daikin

Rheem / Ruud

Verified against each manufacturer's live public registry on 31 August 2026 — every family above confirmed end to end that morning. Lennox and Mitsubishi block automated lookups at their end; those run through your own dealer account. We tell you which is which rather than claiming all of them, because the one thing worse than "I can't check that" is a coverage answer that turns out to be wrong.

Thirty days. Your hardest branch. No charge.

Not your best one. **Pick the branch that's struggling.** If it works there, it works anywhere you own.

WHAT WE NEED

One branch. Thirty days. Your process documents, and one person who can answer questions.

WHAT IT COSTS

Nothing. No contract, no license, no invoice. If it doesn't move a number you already track, you walk.

Measured on what you already track: callback rate, first-time fix, and how fast a new hire runs solo.

Then it grows the way you grow — branch, region, company-wide.
